

## Case Study: Twisting by the Pool

*Amina speakers are installed throughout the pool area.*

**When Alan Willis wanted a stylish way to fill his combination Swimming Pool / Home Theater with high fidelity sound *above and below water*, Amina had just the solution!**

Creating sound in a wet environment can be extremely challenging. Acoustically, the lack of soft furnishings and surfaces leads to highly reverberant spaces. Physically, the high humidity levels and chlorine can combine to create a highly corrosive environment.

And visually, a superior design is vital to the ambiance and feel of the space. Often, however, traditional speakers will disturb this elegance and style. To resolve these issues, Alan Willis chose the new Amina Plaster-in-wall speakers.

The Amina speakers are literally **plastered into the wall**, thus protecting them from the environment while having "zero visual impact" on this beautiful room design.

### THE SYSTEM

For the main pool area, five Amina AIW5 speakers (80W) were installed around the room to create a complete home theater surround sound system. **AMAZINGLY**, two more AIW5 speakers were situated **below water** (behind the tiles), providing sound *underwater*! And in the other areas, Amina AIW3's (40w) were installed to provide audio throughout changing and kitchen areas.

### THE RESULT

This loudspeaker system is incredible. The client got the look he wanted and the sound he desperately desired!
