Amina Introduces ALF40 Low Frequency Bass Enhancer™ Subwoofer

Subwoofer has a visual impact smaller than the footprint of a GU10 lamp.

Cincinnati, OH, United States, 08/27/2009 – Amina Technologies, the world leader in invisible sound solutions, has announced the launch of the ALF40 Bass Enhancer. The compact Bass Enhancer is the first subwoofer designed and engineered specifically to complement Amina's current line of invisible speakers.

Richard Newlove, Managing Director of Amina Technologies Ltd, comments, "With the success of the AIW series speakers, we decided to develop the line further in order to provide a complete solution for the designer. The ALF40 is the culmination of the aesthetics designers have come to expect from Amina, and the extensive research and commitment to quality performance by our R&D

team. The result is a first-in-class Bass Enhancer that combines exceptional acoustic performance with minimal visual impact."

Measuring just 14.2 x 5.3 x 6.3 inches and weighing less than 7lbs., the new Bass Enhancer is a ported, low-frequency enhancement sub that provides extended LF response for low and mid-power applications. As with all of Amina's SoundUnseen® speakers, this passive 40 watt ALF40 provides fantastic sonic performance and can be mounted within ceilings, floors or even furniture.

The ALF40 Bass Enhancer will be available after October 1, 2009 in the USA and Canada through Certified Amina Dealers, and worldwide via Amina's authorized distributor network. It will be on display in Booth 125 at CEDIA Expo 2009 in Atlanta, GA, September 10-13.
